

# PROBABILITY THEORY

## LECTURE 1

Per Siden

Division of Statistics and Machine Learning  
Dept. of Computer and Information Science  
Linköping University

PER SIDÉN (STATISTICS, LiU)

PROBABILITY THEORY - L1

1 / 30

Notes

---

---

---

---

---

---

---

## OVERVIEW LECTURE 1

- ▶ Course outline
- ▶ Introduction and a recap of some background
- ▶ Functions of random variables
- ▶ Multivariate random variables

PER SIDÉN (STATISTICS, LiU)

PROBABILITY THEORY - L1

2 / 30

Notes

---

---

---

---

---

---

---

## COURSE OUTLINE

- ▶ **6 Lectures:** theory interleaved with illustrative solved examples.
- ▶ **6 Seminars:** problem solving sessions + open discussions.
- ▶ **1 Recap session:** Recap of the course.

PER SIDÉN (STATISTICS, LiU)

PROBABILITY THEORY - L1

3 / 30

Notes

---

---

---

---

---

---

---

## COURSE LITERATURE

- ▶ Gut, A. *An intermediate course in probability*. 2nd ed. Springer-Verlag, New York, 2009. ISBN 978-1-4419-0161-3
- ▶ Chapter 1: Multivariate random variables
- ▶ Chapter 2: Conditioning
- ▶ Chapter 3: Transforms
- ▶ Chapter 4: Order statistics
- ▶ Chapter 5: The multivariate normal distribution
- ▶ Chapter 6: Convergence

PER SIDÉN (STATISTICS, LiU)

PROBABILITY THEORY - L1

4 / 30

---

---

---

## EXAMINATION

- ▶ The examination consists of a written exam with max score 20 points and grade limits:  
**A: 19p, B: 17p, C: 14p, D: 12p, E: 10p.**
- ▶ You are **allowed to bring** a pocket calculator to the exam, but no books or notes.
- ▶ The following will be **distributed with the exam**:
  - ▶ Table with common formulas and moment generating functions (available on the course homepage).
  - ▶ Table of integrals (available on the course homepage).
  - ▶ Table with distributions from Appendix B in the course book.
- ▶ Active participation in the seminars gives **bonus points** to the exam. A student who earns the bonus points will add 2 points to the exam result in order to reach grade E, D or C, 1 point in order to reach grade B, but no points in order to reach grade A. Required exam results for a student who earned the bonus points for respective grade:  
**A: 19p, B: 16p, C: 12p, D: 10p, E: 8p.**

PER SIDÉN (STATISTICS, LiU)

PROBABILITY THEORY - L1

5 / 30

Notes

---

---

---

---

---

---

---

---

## BONUS POINTS

- ▶ To earn the bonus points a student must be present and active in at least 5 of the 6 seminars, so maximally one seminar can be missed regardless of reasons.
- ▶ Active participation means that the student has made an attempt to solve every exercise indicated in the timetable before respective seminar and is able to present his/her solutions on the board during the seminar. Active participation also means that the student gives help and comments to the classmates' presented solutions.
- ▶ In the seminars, for each exercise a student will be randomly selected to present his/her solution (without replacement).
- ▶ Exercises marked with \* are a bit harder and it is ok if you are not able to solve these.

PER SIDÉN (STATISTICS, LiU)

## RANDOM VARIABLES

- ▶ The sample space  $\Omega = \{\omega_1, \omega_2, \dots\}$  of an experiment is the most basic representation of a problem's randomness (uncertainty).
- ▶ More convenient to work with real-valued measurements.
- ▶ A **random variable**  $X$  is a real-valued function from a sample space:  $X = f(\omega)$ , where  $f : \Omega \rightarrow \mathbb{R}$ .
- ▶ A **multivariate random vector**:  $\mathbf{X} = f(\omega)$  such that  $f : \Omega \rightarrow \mathbb{R}^n$ .
- ▶ Examples:
  - ▶ Roll a die:  $\Omega = \{1, 2, 3, 4, 5, 6\}$ .

$$X(\omega) = \begin{cases} 0 & \text{if } \omega = 1, 2 \text{ or } 3 \\ 1 & \text{if } \omega = 4, 5 \text{ or } 6 \end{cases}$$

- ▶ Roll two fair dice.  $X(\omega)$ =sum of the two dice.

---

---

---

---

---

---

SAMPLE SPACE OF TWO DICE EXAMPLE

Notes

---

---

---

---

---

---

---

THE DISTRIBUTION OF A RANDOM VARIABLE

- ▶ The probabilities of events on the sample space  $\Omega$  imply a **probability distribution** for a random variable  $X(\omega)$  on  $\Omega$ .
- ▶ The probability distribution of  $X$  is given by

$$\Pr(X \in C) = \Pr(\{\omega : X(\omega) \in C\}),$$

where  $\{\omega : X(\omega) \in C\}$  is the event (in  $\Omega$ ) consisting of all outcomes  $\omega$  that gives a value of  $X$  in  $C$ .

- ▶ A random variable is **discrete** if it can take only a finite or a countable number of different values  $x_1, x_2, \dots$
- ▶ **Continuous** random variables can take every value in an interval.

Notes

---

---

---

---

---

---

---

DISCRETE RANDOM VARIABLE

- ▶ The **probability function** (p.f), is the function

$$p(x) = \Pr(X = x)$$

Notes

---

---

---

---

---

---

---

UNIFORM, BERNOULLI AND POISSON

- ▶ **Uniform discrete** distribution.  $X \in \{a, a + 1, \dots, b\}$ .

$$p(x) = \begin{cases} \frac{1}{b-a+1} & \text{for } x = a, a + 1, \dots, b \\ 0 & \text{otherwise} \end{cases}$$

- ▶ **Bernoulli** distribution.  $X \in \{0, 1\}$ .  $\Pr(X = 0) = 1 - p$  and  $\Pr(X = 1) = p$ .

- ▶ **Poisson** distribution:  $X \in \{0, 1, 2, \dots\}$

$$p(x) = \frac{\exp(-\lambda) \cdot \lambda^x}{x!} \quad \text{for } x = 0, 1, 2, \dots$$

Notes

---

---

---

---

---

---

---

## THE BINOMIAL DISTRIBUTION

- **Binomial distribution.** Sum of  $n$  independent Bernoulli variables  $X_1, X_2, \dots, X_n$  with the same success probability  $p$ .

$$X = X_1 + X_2 + \dots + X_n$$

$$X \sim \text{Bin}(n, p)$$

- Probability function for a  $\text{Bin}(n, p)$  variable:

$$P(X = x) = \binom{n}{x} p^x (1-p)^{n-x}, \text{ for } x = 0, 1, \dots, n.$$

- The binomial coefficient  $\binom{n}{x}$  is the number of binary sequences of length  $n$  that sum exactly to  $x$ .

### Notes

---

---

---

---

---

---

---

## PROBABILITY DENSITY FUNCTIONS

- Continuous random variables can assume **every** value in an interval.
- **Probability density function (pdf)**  $f(x)$

- $\Pr(a \leq X \leq b) = \int_a^b f(x) dx$

- $f(x) \geq 0$  for all  $x$

- $\int_{-\infty}^{\infty} f(x) dx = 1$

- A pdf is like a histogram with tiny bin widths. Integral replaces sums.
- Continuous distributions assign probability zero to individual values, but

$$\Pr\left(a - \frac{\epsilon}{2} \leq X \leq a + \frac{\epsilon}{2}\right) \approx \epsilon \cdot f(a).$$

### Notes

---

---

---

---

---

---

---

## DENSITIES - SOME EXAMPLES

- The **uniform** distribution

$$f(x) = \begin{cases} \frac{1}{b-a} & \text{for } a \leq x \leq b \\ 0 & \text{otherwise.} \end{cases}$$

- The **triangle** or linear pdf

$$f(x) = \begin{cases} \frac{2}{a^2}x & \text{for } 0 < x < a \\ 0 & \text{otherwise} \end{cases}$$

- The **normal**, or **Gaussian**, distribution

$$f(x) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left(-\frac{1}{2\sigma^2}(x - \mu)^2\right)$$

### Notes

---

---

---

---

---

---

---

## EXPECTED VALUES, MOMENTS

- The **expected value** of  $X$  is

$$E(X) = \begin{cases} \sum_{k=1}^{\infty} x_k \cdot p(x_k) & , X \text{ discrete} \\ \int_{-\infty}^{\infty} x \cdot f(x) & , X \text{ continuous} \end{cases}$$

- Example:  $E(X)$  when  $X \sim \text{Uniform}(a, b)$
- The  $n$ th **moment** is defined as  $E(X^n)$
- The **variance** of  $X$  is  $\text{Var}(X) = E(X - EX)^2 = E(X^2) - (EX)^2$

### Notes

---

---

---

---

---

---

---

## THE CUMULATIVE DISTRIBUTION FUNCTION

- ▶ The (cumulative) **distribution function (cdf)**  $F(\cdot)$  of a random variable  $X$  is the function

$$F(x) = \Pr(X \leq x) \text{ for } -\infty \leq x \leq \infty$$

- ▶ Same definition for discrete and continuous variables.
- ▶ The cdf is **non-decreasing**

$$\text{If } x_1 \leq x_2 \text{ then } F(x_1) \leq F(x_2)$$

- ▶ Limits at  $\pm\infty$ :  $\lim_{x \rightarrow -\infty} F(x) = 0$  and  $\lim_{x \rightarrow \infty} F(x) = 1$ .
- ▶ For continuous variables: **relation between pdf and cdf**

$$F(x) = \int_{-\infty}^x f(t) dt$$

and conversely

$$\frac{dF(x)}{dx} = f(x)$$

Notes

---

---

---

---

---

---

---

## FUNCTIONS OF RANDOM VARIABLES

- ▶ Quite common situation: You know the distribution of  $X$ , but need the distribution of  $Y = g(X)$ , where  $g(\cdot)$  is some function.
- ▶ Example 1:  $Y = a + b \cdot X$ , where  $a$  and  $b$  are constants.
- ▶ Example 2:  $Y = 1/X$
- ▶ Example 3:  $Y = \ln(X)$ .
- ▶ Example 4:  $Y = \log \frac{X}{1-X}$
- ▶  $Y = g(X)$ , where  $X$  is discrete.
- ▶  $p_X(x)$  is p.f. for  $X$ .  $p_Y(y)$  is p.f. for  $Y$ :

$$p_Y(y) = \Pr(Y = y) = \Pr[g(X) = y] = \sum_{x: g(x)=y} p_X(x)$$

Notes

---

---

---

---

---

---

---

## FUNCTION OF A CONTINUOUS RANDOM VARIABLE

- ▶ Suppose that  $X$  is continuous with support  $(a, b)$ . Then

$$F_Y(y) = \Pr(Y \leq y) = \Pr[g(X) \leq y] = \int_{x: g(x) \leq y} f_X(x) dx$$

- ▶ Let  $g(X)$  be monotonically *increasing* with inverse  $X = h(Y)$ . Then  $F_Y(y) = \Pr(Y \leq y) = \Pr(g(X) \leq y) = \Pr(X \leq h(y)) = F_X(h(y))$

and

$$f_Y(y) = f_X(h(y)) \cdot \frac{\partial h(y)}{\partial y}$$

- ▶ For general monotonic transformation  $Y = g(X)$  we have

$$f_Y(y) = f_X[h(y)] \left| \frac{\partial h(y)}{\partial y} \right| \text{ for } \alpha < y < \beta$$

where  $(\alpha, \beta)$  is the mapped interval from  $(a, b)$ .

Notes

---

---

---

---

---

---

---

## EXAMPLES: FUNCTIONS OF A RANDOM VARIABLE

- ▶ Example 1.  $Y = a \cdot X + b$ .

$$f_Y(y) = \frac{1}{|a|} f_X\left(\frac{y-b}{a}\right)$$

- ▶ Example 2: **log-normal**.  $X \sim N(\mu, \sigma^2)$ .  $Y = g(X) = \exp(X)$ .  $X = h(Y) = \ln Y$ .

$$f_Y(y) = \frac{1}{\sqrt{2\pi}\sigma} \exp\left(-\frac{1}{2\sigma^2}(\ln y - \mu)^2\right) \cdot \frac{1}{y} \text{ for } y > 0.$$

- ▶ Example 3.  $X \sim \text{LogN}(\mu, \sigma^2)$ .  $Y = a \cdot X$ , where  $a > 0$ .  $X = h(Y) = Y/a$ .

$$\begin{aligned} f_Y(y) &= \frac{1}{y/a} \frac{1}{\sqrt{2\pi}\sigma} \exp\left(-\frac{1}{2\sigma^2}\left(\ln \frac{y}{a} - \mu\right)^2\right) \frac{1}{a} \\ &= \frac{1}{y} \frac{1}{\sqrt{2\pi}\sigma} \exp\left(-\frac{1}{2\sigma^2}(\ln y - \mu - \ln a)^2\right) \end{aligned}$$

which means that  $Y \sim \text{LogN}(\mu + \ln a, \sigma^2)$ .

Notes

---

---

---

---

---

---

---

- Example 4.  $X \sim \text{LogN}(\mu, \sigma^2)$ .  $Y = X^a$ , where  $a \neq 0$ .  
 $X = h(Y) = Y^{1/a}$ .

$$f_Y(y) = \frac{1}{y^{1/a}} \frac{1}{\sqrt{2\pi}\sigma} \exp\left(-\frac{1}{2\sigma^2} (\ln y^{1/a} - \mu)^2\right) \frac{1}{a} y^{1/a-1}.$$

$$= \frac{1}{y} \frac{1}{\sqrt{2\pi}a\sigma} \exp\left(-\frac{1}{2a^2\sigma^2} (\ln y - a\mu)^2\right)$$

which means that  $Y \sim \text{LogN}(a\mu, a^2\sigma^2)$ .

## BIVARIATE DISTRIBUTIONS

- The **joint** (or **bivariate**) **distribution** of the two random variables  $X$  and  $Y$  is the collection of all probabilities of the form

$$\Pr[(X, Y) \in C]$$

- Example 1:

- $X = \#$  of visits to doctor.
- $Y = \#$  visits to emergency.
- $C$  may be  $\{(x, y) : x = 0 \text{ and } y \geq 1\}$ .

- Example 2:

- $X =$  monthly percentual return to SP500 index
- $Y =$  monthly return to Stockholm index.
- $C$  may be  $\{(x, y) : x < -10 \text{ and } y < -10\}$ .

- **Discrete random variables: joint probability function** (joint p.f.)

$$f_{X,Y}(x, y) = \Pr(X = x, Y = y)$$

such that  $\Pr[(X, Y) \in C] = \sum_{(x,y) \in C} f_{X,Y}(x, y)$  and  
 $\sum_{\text{All } (x,y)} f_{X,Y}(x, y) = 1$ .

## CONTINUOUS JOINT DISTRIBUTIONS

- **Continuous joint distribution** (joint p.d.f.)

$$\Pr[(X, Y) \in C] = \iint_C f_{X,Y}(x, y) dx dy,$$

where  $f_{X,Y}(x, y) \geq 0$  is the **joint density**.

- **Univariate distributions: probability is area under density.**

- **Bivariate distributions: probability is volume under density.**

- Be careful about the regions of integration. Example:

$$C = \{(x, y) : x^2 \leq y \leq 1\}$$

## EXAMPLE

- Example

$$f_{X,Y}(x, y) = \frac{3}{2}y^2 \text{ for } 0 \leq x \leq 2 \text{ and } 0 \leq y \leq 1.$$

## BIVARIATE NORMAL DISTRIBUTION

- The most famous of them all: the **bivariate normal distribution**, with pdf

$$f_{X,Y}(x,y) = \frac{1}{2\pi(1-\rho^2)^{1/2}\sigma_x\sigma_y} \times \exp\left(-\frac{1}{2(1-\rho^2)}\left[\left(\frac{x-\mu_x}{\sigma_x}\right)^2 - 2\rho\left(\frac{x-\mu_x}{\sigma_x}\right)\left(\frac{y-\mu_y}{\sigma_y}\right) + \left(\frac{y-\mu_y}{\sigma_y}\right)^2\right]\right)$$

- Five parameters:  $\mu_x, \mu_y, \sigma_x, \sigma_y$  and  $\rho$ .

PER SIDÉN (STATISTICS, LiU)

PROBABILITY THEORY - L1

25 / 30

Notes

---

---

---

---

---

---

---

---

## BIVARIATE C.D.F.

- Joint cumulative distribution function (joint c.d.f.):

$$F_{X,Y}(x,y) = \Pr(X \leq x, Y \leq y)$$

- Calculating probabilities of rectangles

$$\Pr(a < X \leq b \text{ and } c < Y \leq d):$$

$$F_{X,Y}(b,d) - F_{X,Y}(a,d) - F_{X,Y}(b,c) + F_{X,Y}(a,c)$$

- Properties of the joint c.d.f.

- Marginal of  $X$ :  $F_X(x) = \lim_{y \rightarrow \infty} F_{X,Y}(x,y)$
- $F_{X,Y}(x,y) = \int_{-\infty}^y \int_{-\infty}^x f_{X,Y}(r,s) dr ds$
- $f_{X,Y}(x,y) = \frac{\partial^2 F_{X,Y}(x,y)}{\partial x \partial y}$

PER SIDÉN (STATISTICS, LiU)

PROBABILITY THEORY - L1

26 / 30

Notes

---

---

---

---

---

---

---

---

## MARGINAL DISTRIBUTIONS

- Marginal p.f. of a bivariate distribution is

$$f_X(x) = \sum_{\text{All } y} f_{X,Y}(x,y) \text{ [Discrete case]}$$

$$f_X(x) = \int_{-\infty}^{\infty} f_{X,Y}(x,y) dy \text{ [Continuous case]}$$

- A marginal distribution for  $X$  tells you about the probability of different values of  $X$ , averaged over all possible values of  $Y$ .

PER SIDÉN (STATISTICS, LiU)

PROBABILITY THEORY - L1

27 / 30

Notes

---

---

---

---

---

---

---

---

## INDEPENDENT VARIABLES

- Two random variables are **independent** if

$$\Pr(X \in A \text{ and } Y \in B) = \Pr(X \in A) \cdot \Pr(Y \in B)$$

for all sets of real numbers  $A$  and  $B$  (such that  $\{X \in A\}$  and  $\{Y \in B\}$  are events).

- Two variables are **independent** if and only if the joint density can be factorized as

$$f_{X,Y}(x,y) = h_1(x) \cdot h_2(y)$$

- Note: this factorization must hold for **all** values of  $x$  and  $y$ . Watch out for non-rectangular support!
- $X$  and  $Y$  are independent if learning something about  $X$  (e.g.  $X > 2$ ) has no effect on the probabilities for different values of  $Y$ .

PER SIDÉN (STATISTICS, LiU)

PROBABILITY THEORY - L1

28 / 30

Notes

---

---

---

---

---

---

---

---

MULTIVARIATE DISTRIBUTIONS

- Obvious extension to more than two random variables,  $X_1, X_2, \dots, X_n$ .
- Joint p.d.f.

$f(x_1, x_2, \dots, x_n)$

- Marginal distribution of  $x_1$

$f_1(x_1) = \int_{x_2} \cdots \int_{x_n} f(x_1, x_2, \dots, x_n) dx_2 \cdots dx_n$

- Marginal distribution of  $x_1$  and  $x_2$

$f_{12}(x_1, x_2) = \int_{x_3} \cdots \int_{x_n} f(x_1, x_2, \dots, x_n) dx_3 \cdots dx_n$

and so on.

Notes

---

---

---

---

---

---

---

FUNCTIONS OF RANDOM VECTORS

- Let  $\mathbf{X}$  be an  $n$ -dimensional continuous random variable
- Let  $\mathbf{X}$  have density  $f_{\mathbf{X}}(\mathbf{x})$  on support  $S \subset \mathbb{R}^n$ .
- Let  $Y = g(X)$ , where  $g : S \rightarrow T \subset \mathbb{R}^n$  is a bijection (1:1 and onto).
- Assume  $g$  and  $g^{-1}$  are continuously differentiable with Jacobian

$$\mathbf{J} = \begin{vmatrix} \frac{\partial x_1}{\partial y_1} & \cdots & \frac{\partial x_1}{\partial y_n} \\ \vdots & \ddots & \vdots \\ \frac{\partial x_n}{\partial y_1} & \cdots & \frac{\partial x_n}{\partial y_n} \end{vmatrix}$$

THEOREM

(“The transformation theorem”) The density of  $Y$  is

$f_Y(\mathbf{y}) = f_{\mathbf{X}}[h_1(\mathbf{y}), h_2(\mathbf{y}), \dots, h_n(\mathbf{y})] \cdot |\mathbf{J}|$

where  $h = (h_1, h_2, \dots, h_n)$  is the unique inverse of  $g = (g_1, g_2, \dots, g_n)$ .
